

React

PAMODA ANGELO KONARA
NOVEMBER 2024

Idea

I first started to learn React to have the possibility to use 3D Models in my website, by learning react-three-fiber. Something new that is not common everywhere, but is something that I really liked from the beginning, that has the possibility to create cool website. In fact I merged this 3D feature with one of my passion, building on a videogames, in this case Minecraft, with my imagination I can add block in the game and transfer the build on the website. Than with gsap, that is a framework JavaScript Animation library I started learning simple animation for example the title. Finally I started learning Tailwind CSS, a simple way, different from Bootstrap to personalize your website

Creation

The website is simple, it isn't really complicated or impressive, but it's something to learn from, something that I'm proud to have built from scratch. I have a lot to improve, but it's a really good start.

I used gsap to animate the main title, that appear a little bit after the 3D model, same with the timer's title and for the carousel's title I made that it appears after you first go to the section by moving below the screen.

The timer's component uses the useState hook to store the state of the timer, including whether it has started, whether it is paused, and the current hours, minutes, and seconds. It also uses the useEffect hook to set up and clear the timer interval when the component mounts and unmounts. The handleStart, handlePause, handleResume, and handleReset functions handle the respective button clicks.

The carousel is a really basic image slider, the component uses the useState hook to keep track of the current slide index.
